Sasa Smart Module

Maximize Solar Module Power

SASA SMART HOT-SPOT FREE technology protects each cell by an individual bypass diode

SASA Smart Module technology protects each cell by an individual bypass diode. When the current of a single cell does not match the current of the whole string, that cell has a reverse voltage, when measured more than 0.6V, it will automatically activate the bypass diode. As a result, the rest of the cells will not be affected by the disruption. The heated cell will consume less energy generated by the unaffected cells, and produce less heat. Meanwhile, only the heated cell will be bypassed, and the rest of good cells will continue generating power.

INCREASED EFFICIENCY AND YIELD

This new technology prevents instant falls in the module output, thus increasing the performance ratio up to 30%. The SASA Smart module loses the output of only one single cell during the shading, while a standard module will lose output of all cells in a string.

SAFETY AND RELIABILITY

With lower operating temperature less than 85°C, SASA Smart module not only eliminates potential causes for back sheet degradation but also prevents damage to silicon-based cells, hence enhancing reliability and ensuring more safety of the module.

ENHANCED LIFETIME

The lifetime of SASA Solar Hot-Spot Free Module is up to 25 years over standard warranty term of modules on the market.

MORE SOLAR POWER

When multiple cells are in shading, a hot-spot free module can generate up to 80% more power, compared to a standard module.
